Introductory Fourier Transform Spectroscopy

By **ROBERT JOHN BELL**
Department of Physics and
Graduate Center for Materials Research
University of Missouri–Rolla
Rolla, Missouri

This book discusses the history, basic theory, design, use, and advantages of all types of Fourier transform spectrometers. It is designed to enable those in many areas of science and engineering to master the new field of high resolution fast spectroscopy using interferometers.

Early chapters of the book discuss the elementary derivations of the governing spectral equations controlling resolution, apodization, and experimental parameters. The next chapters describe applications amd interferometers other than the ordinary or symmetric Michelson interferometer—i.e., the plane lamellar, the asymmetric Michelson, the polarizing Michelson, and spherical lamellar instruments. Finally, the book considers the latest versions of the Cooley-Tukey fast Fourier transform algorithm and the resultant computer programs—including one program for real-time analysis on very small computers. Logic and mathematical details are given for all derivations, and the book has many figures illustrating the applications in chemistry and atmospheric, astro-, solid state, and general physics.

The treatment is such that the beginner can completely learn the rudiments and the advanced reader can gain further acquaintance with the broad scope of Fourier spectroscopy. There are very extensive author and subject bibliographies and author and subject indices. The book will be of special interest to spectroscopists, optical engineers and scientists, chemists, and physicists.

Molecular Spectroscopy: Modern Research

Edited by **K. NARAHARI RAO**
Department of Physics
The Ohio State University
Columbus, Ohio

C. WELDON MATHEWS
Department of Chemistry
The Ohio State University
Columbis, Ohio

This volume contains reviews of current advances in several phases of research in high resolution molecular spectroscopy. Particular emphasis is placed on electronic, infrared, and microwave studies of molecular species in gas phase and in matrices. Included also are representative articles which feature discussions of such topics as:

- Techniques employed in high-resolution spectroscopy
- Astrophysical aspects of molecular spectroscopy
- Infrared molecular lasers
- Applications of molecular spectroscopy in biophysics
- An introduction to molecular lamb-dip spectroscopy

This book includes nearly 1400 references to the literature, as well as tables giving wavelength standards, fundamental constants, atomic masses and conversion factors.

The discussions, data, techniques, references, and tables presented in this book will be of great value to chemists, physicists, astrophysicists, and laser scientists.
